Summary

Software engineer with about three years building LLM applications and workflow automation. At Firestorm Internet I build the AI content pipeline (Python, Bash, WP-CLI) behind 68 of the company's 117 sites, which took site production from about 5 a month to 32 in four weeks. At UiPath I built enterprise RPA automations that routed a classifier's output for 10K+ emails a month into SAP and ServiceNow. I design systems, build them with Claude Code, and verify LLM output instead of trusting it.

Skills

AI and LLM: LLM applications and pipelines (Claude, OpenAI, OpenRouter), AI agents and agentic workflows, MCP (Model Context Protocol) servers, LLM output verification and evaluation (citation checks, run-to-run variance), Claude Code
Automation and RPA: UiPath (Studio, Orchestrator, Apps, Computer Vision, Communications Mining), RPA, workflow automation, SAP and ServiceNow integrations, WP-CLI, Bash
Backend: Python, FastAPI, REST APIs, Celery, Redis
Frontend: TypeScript, React, Next.js
Databases: PostgreSQL, MySQL (TiDB Cloud), SQL, Prisma
Cloud and DevOps: Docker, GCP, Vercel, Git
Testing: pytest, Vitest

Experience

Software Engineer

Firestorm Internet · Chennai, India · Jul 2025 - Present
A network of attraction-ticket and destination sites, earning through GetYourGuide, Viator and Tiqets affiliate programmes.

- Built the AI content automation pipeline (Python, Bash, WP-CLI) behind 68 of the network's 117 sites: LLM content generation, GetYourGuide image sourcing, and WordPress setup and deploy through WP-CLI. Per-site build time fell from 4-10 days to a few hours: 32 sites in the first four weeks and 36 in the next four, up from about 5 a month. The sites earned ₹1L+ in affiliate commission in the first month.
- Split a single-prompt pipeline into separate LLM stages (content with Claude, then HTML and templates with Python and Claude) after the single-prompt version failed on quality; quality improved once each stage had one job. Kept a human gate on image selection, where the model was least reliable and a wrong output going live cost the most.
- Removed the review bottleneck the pipeline created: built a review template, an AI agent that turns the writers' review into todos, and a second agent that reads the code, decides whether each issue is an exception or a code bug, and fixes it. One review round went from a few hours to under 45 minutes; every fix was checked by me, then by the writers on the re-run.
- Built CrowdTracker (crowd-tracker.com), a Firestorm product that tells travellers when to visit an attraction. Sole developer: migrated it from React/PHP to Next.js, and organic users grew from 60-70 a day to 600+ a day (17,331 users and 25,463 page views in the 28 days to 15 Oct 2026, GA4).
- Built an internal contact tool (React, FastAPI) that pulls enquiries from 40+ sites into one Gmail-integrated inbox.
- Built a background job queue on Celery and Redis, and containerised services with Docker.

Associate RPA Developer

UiPath · Chennai, India · Feb 2023 - Nov 2024

- Built the RPA automations around a UiPath Communications Mining email classifier (85-90% accuracy on historical data; model owned by an AI scientist), routing 10K+ emails a month from 200+ sources into SAP and ServiceNow.
- Redesigned exception handling, routing and validation across the SAP and ServiceNow integrations, which raised workflow throughput by 70%.
- Built remote-desktop automations with UiPath Computer Vision for data extraction and form filling on legacy enterprise screens.
- Fixed a medical-insurance client's invoice intake by changing the input, not the model: invoices came in too many layouts for Document Understanding, so we gave their team an Excel template with drop-downs. Complete entries went from roughly 40% to 80%, which unblocked the Computer Vision step that keyed them into the client's system.
- Led most client delivery calls, walking client teams through what was being automated and how.

Projects

Outbuiltit · founder, indie product studio · 2025 - Present

outbuiltit.com · my own studio; two live products, built solo

- escalation-gate (Python, PostgreSQL, MCP · gate.outbuiltit.com · github.com/rdeepak-711/escalation-gate): takes a GitHub issue, finds the root cause, checks every code citation against the source, and names the open PR that fixes it and whether it merges cleanly. The LLM is used in two of six stages; the other four verify or narrow its work: a citation checker, a SQL shortlist from diff hunk ranges (192 open PRs down to 25), git merge-tree dry-run merges, and a packet that separates model reasoning from checked facts.
- On HackerRank's open-source hiring-agent: 6 of 6 citations verified at $0.03-0.45 a run. It caught a mistake in my own manual review and a PR that would crash on merge, and found an unreported bug, filed upstream as issue #479 with fix PR #480.
- Built an MCP server with four tools (start, status, board, stop) so an AI agent such as Claude Code can sweep a repo's top open issues in the background and get, per issue, the PR to merge, duplicate fixes, and a confidence level built only from checks that ran.
- LifeDots (lifedots.outbuiltit.com): a Chrome extension, published on the Chrome Web Store, that counts real minutes on the sites a user picks for one habit, with no network requests.
- WhatsApp bots (Next.js, TypeScript, Prisma, MySQL on TiDB Cloud, Meta WhatsApp Cloud API, Razorpay): GlowZone, a salon booking bot with a pure finite-state-machine core, LLM intent parsing on top with keyword fallback, an owner dashboard that prevents double-booking, and 495 Vitest tests; then a multi-tenant ordering bot (17-state machine, HMAC-verified Razorpay webhooks).

Résumé-scorer variance audit · Python, OpenRouter · 2026

- LLM evaluation: reran HackerRank's open-source AI résumé scorer on one résumé; even at temperature 0 the score moved between 74 and 77.

Education

B.E. Computer Science and Engineering

Coimbatore Institute of Technology · 2019 - 2023 · CGPA 8.5/10
